

CeleNation Fantasy

What changed in this release · Prepared for ownership review

This release moves CeleNation Fantasy from a demo prototype to a production-ready paid product. The application now stores real accounts in the cloud, accepts secure card payments, gives commissioners full control over their league, and includes a marketing demo visitors can explore without signing up.

Headline: Players can now sign up, pay the \$35 season fee, and access their league from any device. Their roster, draft picks, and matchup results follow them everywhere — there is nothing for the commissioner to set up manually.

01. Real Accounts That Save Everywhere

Previously, the app stored everything inside the browser. If a player signed up on their laptop, they could not sign in from their phone — and clearing the browser would erase their roster. The app has been rebuilt with a cloud database, so every account, every roster, and every draft pick is stored centrally and follows the player to any device.

BEFORE

Accounts lived only in the browser. Switching devices meant losing access. Clearing cookies erased everything.

NOW

Sign in once, your league follows you. Phone, laptop, friend's computer — same league, same roster, instantly synced.

What this unlocks

- Players can use the app from any phone, tablet, or computer.
- Rosters, draft picks, weekly stats, and transactions are stored securely in the cloud.
- Other players' draft picks appear automatically on everyone's screen — no manual refresh needed.

02. Stripe Paywall for the \$35 Season Fee REVENUE

The signup form now collects payment before creating an account. Players enter their info, click *Continue to Payment (\$35)*, complete the purchase on Stripe's secure checkout page, and are automatically signed in to a finished account.

How the payment flow works

1. Player fills in username, password, security question, and avatar.
2. Clicks *Continue to Payment* — redirected to Stripe's hosted checkout.

3. Pays with any credit or debit card.
4. Returned to the app, signed in, ready to play.

Safety nets built in

- **Closed-tab protection:** if a player closes their browser mid-payment, a Stripe webhook still creates the account on the server side — no support tickets, no lost customers.
- **Duplicate-username protection:** if two people pick the same name during checkout, only the first one is honored. The second gets a clear refund-eligibility message.
- **Test-mode first:** the entire system was validated in Stripe test mode before being switched to live keys for real money.

Net effect: Every new account = \$35 in revenue, collected automatically. Stripe handles the cards, the receipts, the refunds, and the disputes. The owner sees the money land in their bank within 2 business days of each charge.

03. Commissioner Tools ADMIN

The admin panel now includes a complete set of tools so the commissioner is never blocked by technical issues. Every common request a player might make can be solved without touching the database.

FEATURE	WHAT IT DOES
Grant Free Account	Create an account for any player without charging them. Use for sponsors, comps, or family members. Optional checkbox grants them admin rights too.
Reset a Player's Password	If a player loses their password and can't remember their security answer, the commissioner can reset it to anything in two clicks.
Admin Bypass Code	A private code (set by the owner) that lets fellow commissioners sign up as admins without payment. Skips Stripe entirely.
Cloud Connection Status	One-glance health check showing whether the league is online and saving correctly.

04. Account Self-Service for Players

Players now have everything they need to manage their account without contacting the commissioner.

Change Password

Click the key icon in the top right. Modal asks for current password and new one.

Security Question

Forgot Password

Recovery via security question chosen at signup. Resets without commissioner help.

Sign Out / In

Chosen by the player at signup. Hashed and stored — even an admin can't read the answer.

Standard nav button. Works across devices since accounts now live in the cloud.

05. Scoring Fix — Top 5 of 7 Players BUG FIX

The original code summed all 7 roster players when calculating weekly fantasy points. This was incorrect — only the **5 best performers each week** should count toward a team's score. This has been corrected throughout the application.

BEFORE

All 7 players' fantasy points were added together for the team total. There was no incentive to draft depth — every player counted equally.

NOW

The 5 best performers each week count. The remaining 2 are bench depth, ready to step in if a star player has an off week. Visible on the *My Team* page with ✓ marks.

Where this applies

- **My Team page:** roster now sorted by fantasy points; top 5 are marked with a green ✓, bottom 2 are dimmed.
- **Matchups:** the week's score for both teams uses only top 5.
- **Standings:** wins and losses now reflect proper top-5 scoring.
- **Championship bracket:** playoff scoring is also top-5-only.

06. Championship Bracket — Top 4 From Each Group

The playoff format now matches the league rules:

- Two groups of 8 players each play a 7-week round robin.
- The **top 4 from each group** qualify for the championship — 8 qualifiers total.
- These 8 players run a fresh re-draft from the full player pool (the "championship draft").
- Standard 8-team single-elimination bracket: **Quarterfinals** → **Semifinals** → **Final**.

Seeding

The bracket uses cross-group seeding so the two #1 seeds can only meet in the Final, ensuring the best matchups happen at the right time:

ROUND	MATCH
QF1	Group 1 #1 vs Group 2 #4
QF2	Group 1 #3 vs Group 2 #2
QF3	Group 2 #1 vs Group 1 #4
QF4	Group 2 #3 vs Group 1 #2

ROUND	MATCH
SF1	Winner QF1 vs Winner QF2
SF2	Winner QF3 vs Winner QF4
Final	SF1 winner vs SF2 winner — Champion crowned

07. Live Draft Experience

The draft room now feels alive even with everyone in different rooms.

Turn Notification

A two-note ding-ding sound plays when it becomes your turn to pick.

Live Pick Sync

Other players' picks appear on every screen within ~4 seconds — no refresh needed.

Tab Title Flash

The browser tab title flashes "🏀 YOUR PICK!" so you notice even if minimized.

Shot Clock

60-second auto-pick if a player is away from their phone. Keeps the draft moving.

08. Marketing Demo at </demo> **MARKETING**

A self-contained demo version of the app lives at **celenationfantasy.netlify.app/demo**. Anyone can visit, poke around, and see the full experience without signing up or paying anything.

How the demo works

- **No sign-up required.** The visitor lands directly inside a fully populated league as a fake user ("DemoYou").
- **Mid-season feel.** Eight fake players, completed draft, week 4 of 7, partial matchups in progress, realistic standings.
- **Stage toggle.** A floating button in the corner lets visitors flip between *Mid-Season* view and *Group Stage Complete* (final standings).
- **Zero risk.** Nothing the visitor does is saved anywhere. A page refresh restores the pristine demo. Real users and real data are completely isolated.
- **Sales link built in.** The demo banner includes a "Try the real app →" link directing visitors to the real signup.

Use this for: social media posts, sponsor pitches, recruiting new players, league-launch marketing. Send anyone the link — they'll get an instant tour of what the product does.

09. Security & Reliability SECURITY

Password security

- Passwords are **never stored in plain text**. They are hashed with a per-account salt using scrypt — the industry standard for password storage.
- Password hashes are **not readable from the browser**. Only the server-side functions (which have a separate secret key) can compare them. A leak of the public site's code would not expose any passwords.

Stripe integration security

- Card data is handled entirely by Stripe. It never touches our servers.
- Stripe webhook signatures are cryptographically verified, so no one can forge a fake "payment succeeded" event.
- The Stripe secret key, Supabase service key, and admin bypass code are stored as environment variables — they are not in the public code.

Resilience

- **Two independent paths** create the account after payment: the success page redirect AND the Stripe webhook. Whichever fires first wins. The other one safely no-ops.
- A pre-existing latent bug in the scoring code (which would have crashed the app once any real draft completed) was caught and fixed before going live.

10. Infrastructure & Deployment OPS

The application now deploys automatically when code is updated, eliminating manual upload steps and reducing the chance of mistakes.

GitHub Repository

All code lives in a private GitHub repo with full version history.

Netlify Auto-Deploy

Pushing a change to GitHub triggers a deploy in ~30 seconds. Zero manual steps.

Supabase Cloud Database

Hosted PostgreSQL on Supabase's free tier. Handles all account and league data.

Netlify Functions

Server-side logic (login, signup, password reset, payment finalization) runs as serverless functions.

Hosting cost summary

SERVICE	USE	COST
Netlify	Web hosting + serverless functions	Free tier (sufficient for current scale)
Supabase	Database for accounts & league data	Free tier (50,000 requests/day)
Stripe	Payment processing	2.9% + \$0.30 per transaction (~\$1.32 per \$35 sale)
GitHub	Code storage	Free (private repo)
Total fixed monthly cost		\$0

Net revenue per signup: \$35.00 – \$1.32 Stripe fee = **\$33.68 per player.**

11. What's Next

Optional improvements available on request:

- **Email-based password reset.** Currently uses security questions. Email reset (via a service like Resend) would feel more familiar to players.
- **Multi-group demo & bracket showcase.** The current demo has one group. A "Playoffs" demo stage would auto-generate two complete groups with a populated bracket — great for marketing.
- **Profile editing.** Right now players can change their password. Avatar upload and username changes could be added.
- **Push notifications.** The browser tab flashes on a draft turn. Real push notifications (so players get pinged even when the app is closed) would lift the experience.
- **Tax handling.** Stripe Tax can be enabled if sales volume grows enough to need it.
